TRENCHES		Zinc	0.233 %	a drill hole (W-79-1), located north east of the Keystone and immediately south east of Anaconda trenches, intercepted a quartz diorite with quartz-pyrite-sericite-potassium feldspar-molybdenite stockworks and sporadic quartz-sphalerite-galea+/-rhodochrosite+/-chalcopyrite veins. The quartz-molybdenite veins average 10 centimetres in width but vary up to 15 centimetres in width and average 1 per 2 metres. Assays of the drill core yielded an average of 0.233 per cent zinc with 3.5 grams per tonne silver over 265 metres (977 to 1240 metres down-hole) and 0.044 per cent molybdenum over 308 metres (1050 to 1358 metres down-hole) with several 3 metre sections yielding up to 0.133 per cent molybdenum Assessment Report 7771
